CONFIDENTIAL

Existing chimney operate under thermal siphoning systems, with average temperatures of 400 to 500°F, which may ~~breakdown or~~ create ~~other~~ malfunctions of existing furnace equipment when pressure system such as air-fed incinerator is injected. ~~which~~ creates temperatures between 1000 to 2000°F. This may result back pressure ~~but less likely in danger~~ or other equipment using the chimney. When feasible a separate stack is recommended for air-fed.
